### VERY LIKELY

\* This scenario takes into account the effects of the EIP-1559 resolution. The current average block reward on May 1, 2021 is 2.5 eth (from etherscan) and the profitability numbers above reflect this amount. After the EIP-1559 resolution is implemented (expected in sometime July 2021), this block reward will be lowered to the standard 2 ether per block (plus rush fees). This will lower our profits from mining from its current number to 2/2.5 of what it is now, or 80% of what it is now (a decrease of 20%). Note that due to miners potentially exiting the network from the reduced fees, we may see a reduced network difficulty, so this is a conservative estimate of the results. Furthermore, the block reward will not only be the 2 ether per block, but will also include priority transaction fees. So the amount of discount in this scenario represents a worst-case scenario for a reduced block reward. This scenario discounts the revenue from mining by 35% to simulate the effects of EIP-1559.

## Market Crash

Discount	94%														
Card	1070	1080	1080 Ti	1660s	2060	2060s	2070	2070s	2080	2080s	2080Ti	3060 Ti	3070	3080	3090
Revenue/Day (CAD)*	0.12	0.14	0.18	0.12	0.13	0.17	0.18	0.17	0.17	0.17	0.24	0.24	0.24	0.38	0.48
Gross Profit/Day (CAD)	-0.18	-0.19	-0.41	-0.10	-0.10	-0.10	-0.12	-0.14	-0.10	-0.18	-0.33	-0.06	-0.06	-0.16	-0.23
ROI Time (days)	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Annual Returns	-11%	-10%	-16%	-6%	-4%	-4%	-4%	-5%	-3%	-7%	-7%	-2%	-2%	-3%	-3%

### VERY UNLIKELY

\* This scenario will consider then impacts of an immediate market crash similar to the one following the 2017-2018 speculative bubble into cryptocurrencies. In 2018, the price of Ethereum fell from a high of \$1405 on Jan 9 to 83 USD at the lowest point on Dec 15 (from Coindesk). This reflects a 94% reduction in price and hence mining profits. This scenario discounts revenue by 94% to simulate a market crash. Note that in this scenario, in contrast to the above scenario, the loss of mining revenue is due to a discounted price of Ethereum whereas in the above scenario, revenue decreased from a reduction in ETH paid as a block reward for mining.

## Market Correction

Discount	65%														
Card	1070	1080	1080 Ti	1660s	2060	2060s	2070	2070s	2080	2080s	2080Ti	3060 Ti	3070	3080	3090
Revenue/Day (CAD)*	0.70	0.84	1.07	0.70	0.75	0.98	1.02	1.00	1.00	0.98	1.38	1.41	1.41	2.24	2.80

ROI Time (days)	1495	1389	1992	1261	1531	1335	1374	1445	1771	1572	2225	1079	1078	1064	1245
Annual Returns	24%	26%	18%	29%	24%	27%	27%	25%	21%	23%	16%	34%	34%	34%	29%

### LIKELY

\* This scenario recognizes that the price depreciation from a market correction will not be instantaneous and will take time similar to the previous crash. This scenario will consider the impacts that a market pullback of similar proportion to the one observed in 2018. In that market pullback from Jan 9 to Dec 15 2018, the average daily closing price of Ethereum was \$485 compared to the peak of \$1405 USD. In this scenario, we will consider a revenue reduction in Ethereum by 65% to simulate the actual average daily profitability in the case of a similar market decline.
